

Innovative Touch & Slide Operation for GreCon Spark Detection and Extinguishment Systems

Innovative Touch & Slide Operation for GreCon Spark Detection and Extinguishment Systems

The first spark detection and extinguishment system worldwide with touch screen display and operation function.

The new 10" colour display with touch and slide function enables you to quickly call up desired information in a self-explaining and compact way from different levels of the GreCon control console.

Thus, it will be quite easy to have all relevant information available in future. Not only data that is to be available quickly after an alarm, but also long-time information from deeper levels can be shown on one and the same display.

The possibility to represent complete flowsheets is especially to be emphasised. Areas that are concerned by current alarms can be examined more closely by means of the simple zoom function.

Intuitive Operation, Safe Operation

The touch and slide operation extremely improves the handling of your control console. The concept for an intuitive operation was based on the handling of modern mobile phones of the latest generation. Operating errors are practically impossible so that, following the safety concept, a safe utilisation of the entire system is possible without considerable need for training.

Important Information Available Quickly

Important data can be displayed ad hoc by direct selection of information via clear symbols. Furthermore, the display memory offers room to store electronic files, such as instruction and operating manuals, which can be used, if required, when a paper printout is not available.

High Protection

The protection IP 54 allows an unproblematic and reliable utilisation of the display in any industrial environment. Generally, there are no special demands on the installation place of the control console.

Retrofittable

The touch screen display can be retrofitted in many cases so that the current operation ease can also be realised for existing GreCon control consoles.

Information can be selected and called up from the current screen content by means of direct touch. Details can be zoomed in without having to work through complicated menus by means of the slide function.

Options

- Internet connection
- SMS/E-Mail transmission
- Printer connection
